Phase 3: Project Design

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Solution architecture, flow design and data model

1. Solution Overview

The design uses the native ServiceNow Service Catalog together with Flow Designer. When a Standard Laptop is ordered, the Service Catalog trigger starts the flow, which creates a Catalog Task assigned to the Hardware group.

2. High-Level Flow

3. Flow Design

Component	Design Decision
Flow name	Standard Laptop task
Trigger	Service Catalog
Action 1	Create Catalog Task
Request Item input	Trigger > Requested Item (data pill dragged in)
Table (auto-filled)	Catalog Task [sc_task]
Fields set	Short description, Description, Assignment group = Hardware, Approval = Approved
Wait	Enabled (default)

4. Data Model

Table	Purpose	Relationship
sc_request	Overall request (REQ)	Parent of RITM
sc_req_item	Requested item (RITM)	Parent of catalog tasks
sc_task	Catalog Task (SCTASK) for hardware team	Child of RITM
sys_user_group	Hardware assignment group	Referenced by Assignment group

5. User Flow

1. Requester opens Service Catalog > Hardware > Standard Laptop and clicks Order Now.

2. Order Status page shows the Request number.
3. Approver approves the request from the Approvers tab.
4. Flow creates the Catalog Task, visible under the RITM > Catalog Tasks tab.
5. Hardware team opens the task and configures the laptop.

6. Design Considerations

- No-code flow keeps the solution easy to change later.
- Assigning to a group (not a person) avoids single-person dependency.
- Flow is attached at catalog-item level, so other items are not affected.
